ABSTRACT

In my workplacement at the department of wafer testing at Infineon Technologies in Villach I work on three bigger topics. The first one is about generation and automation of reports of production data using the business intelligence tool "Tableau". For the second topic I visualize data from Oracle databases using SQL queries. The third topic is to extract and analyze data from the logfiles of machines in form of CSV files. Further steps will be to find associations between the alarms of machines and different product types.

We hope to see you there!
