**“Well-posedness of a system of Helmholtz equations in the
framework of nonlinear acoustics”**

📍 N.2.01

📅 Wednesday, 26 June 2024

🕒 12:00 p.m.

Abstract

This work placement revolved around exploring the fundamentals of both linear and nonlinear acoustics as well as methods and techniques which are used to show well-posedness of the underlying mathematical models. Many prominent models for describing phenomena in nonlinear acoustics are based on the (nonlinear) Westervelt equation. In case of a periodic sound excitation it is possible to find an approximate solution to it by considering a finite system of Helmholtz equations. Under (relatively) weak assumptions this system has a unique solution. I will outline the proof of well-posedness for the finite system of Helmholtz equations using fixed-point arguments.

Barbara Kaltenbacher and the Department of Mathematics look forward to seeing you at the talk!
