N.2.01

ABSTRACT

In 2024, Infineon developed a code to determine the lifetime variation of their microchips. My task during the internship was to implement this code on servers and test it for correctness. I also had to implement additional functions, including an error system, to ensure the code functioned correctly in case of errors. During the internship, I used the programms R and CEDA/Cornerstone. In this presentation, I will explain how I solved the tasks and what problems I encountered during the internship.

We hope to see you there!
